

RLP chassis upgrade

Completely new internal chassis

Our new design incorporates an updated internal chassis that completely isolates the vital electronics and internal load cell components from the internal battery compartment and outside ambient conditions.

The end result is an even more robust Radiolink Plus that provides IP67/NEMA6 environmental protection even with a missing battery compartment cover.

The third generation of our bestselling Radiolink Plus is now in production. The latest version includes many benefits over previous models including:

- Advanced circuitry with reverse polarity and overcurrent protection.
- Completely new internal chassis providing increased environmental protection
- New machined corners provide increased mobility in clevis type applications
- Easy to remove 'single screw' battery cover design.

We can now also offer an upgrade service for older version Radiolink loadcells allowing you to extend the life of your loadcell and obtain all the extra benefits detailed above.

Please send us the serial number of your loadcell to sales@straightpoint.com and we will send you an offer for a quick and simple upgrade of your existing product!

Advanced circuitry

Our new advanced circuitry provides protection from potentially disastrous reverse polarity and over current situations.

This new circuitry virtually eliminates battery leakage and rupture issues associated with improperly installed or the mixing of old and new batteries.

The result is reduced downtime and increased battery life.
